

# Web Databases

**CSCI 3000**  
**Web Programming**

*Dr. Luis A. Cueva-Parra*

# Introduction

- ❑ Databases are important components of information systems.
- ❑ It is particularly important when we use them as part of web applications.
- ❑ In this course we will try to answer some questions like:
  - ❑ Why do we need a database?
  - ❑ What problems do we face if we do not have one?
  - ❑ What are the available database software options?

# Understanding Databases

- ❑ What are databases? They are tools for solving certain problems.
- ❑ Those problems arise from having data that need to be stored.
- ❑ Data or information may include information about customers, products, employees, orders, details about the visits to your website, etc.

# Understanding Databases

- ❑ The data could be in text format, it could be names and descriptions, or numeric amounts, or dates, or this could be document files or images, audio, or video.
- ❑ You can store some of this data in files and/or spreadsheets. If they are documents you can store them in folders.
- ❑ Having data is not a good enough reason to need a database.
- ❑ Having data is not the problem.

# Potential Problems Related to Data

- ❑ Problems with data:
  - Size of the data is a potential problem.
  - Ease of updating your data
  - Accuracy of it
  - Security of it
  - Redundancy in it
  - Importance of the data.
- ❑ These are the reasons of having a database

# Potential Solutions

- ❑ The database can make the data:
  - Scalable
  - Accessible
  - Accurate
  - Secure
  - Consistent
  - Permanent
- ❑ Databases give us **structure**. It imposes rules on the data.

# Database Management Systems (DBMS)

- ☐ Oracle
  - ☐ SQL Server
  - ☐ MySQL
  - ☐ PostgreSQL
  - ☐ MongoDB
- 
- ☐ DBMS are software that need to be installed

# Database and DBMS

- ❑ The **database** is your data and your rules about that data.
- ❑ The **database management system**, the DBMS, is the program or the set of programs that surround and manage it, to make sure your rules are applied.

# Relational DBMS

- ☐ Oracle
  - ☐ SQL Server
  - ☐ DB2
  - ☐ MySQL
  - ☐ PostgreSQL
  - ☐ SQLite
  - ☐ MS Access
- 
- ☐ Relational DBMS are the most common

# Relational DBMS

- ❑ Relational DBMS are the most widely used
- ❑ They use the same principles across all offerings
- ❑ Are foundational for understanding other systems.

# Database Fundamentals

- ❑ Features of Relational Database:
  - Consists of Tables as main building blocks
- ❑ Tables: Rows and Columns

# Tables

# Table Design

- ❑ Apply structure to data defining how the information will be stored in the table.

FirstName	LastName	HireDate	Grade	Salary
Alice	Mann	4/4/2012	5	80000
James	Black	3/7/2016	4	75000
Calista	Guerra	8/15/2008	7	90000
Fay	Fitzgerald	11/5/2014	5	80000

# Table Design

- ❑ By deciding what the columns are, and defining them, we are imposing rules on the data.
- ❑ Once we describe these rules, the database management system will not let us break them.
- ❑ **Tables** and **columns** are defined up front.
- ❑ Day-to-day use is in creating and updating **rows**.

# Unique Values and Primary Keys

- ❑ All tables in a database will require a **key**.
- ❑ A **key** identifies one particular row in a table.
- ❑ The **key** will be in a defined column, which contains *unique values* per row.
- ❑ Examples of **keys** are ISBN numbers, SS numbers, employee ID numbers, etc.
- ❑ The main **key** in a database is called *primary key*.

# Unique Values and Primary Keys

- ❑ If natural unique values are not suitable for being keys (e.g. SS numbers) then the DBMS generates a primary key (e.g. customer number)
- ❑ Generated primary keys are also called *synthetic keys* or *surrogate keys*.

# Defining Table Relationships

## ❑ Customer Table

ID	firstName	lastName	email	address
367	Carl	Brown	br@a	22 Stone Ct
368	Vincent	Scott	sc@b	123 River Rd
369	Lynn	Allen	all@c	47 Main st.

## ❑ Order table

orderID	Date	Quantity	Total	ID
367	2/11/2018	23	\$956.00	367
368	6/23/2017	14	\$580.00	368
369	5/11/2016	56	\$1590.00	367

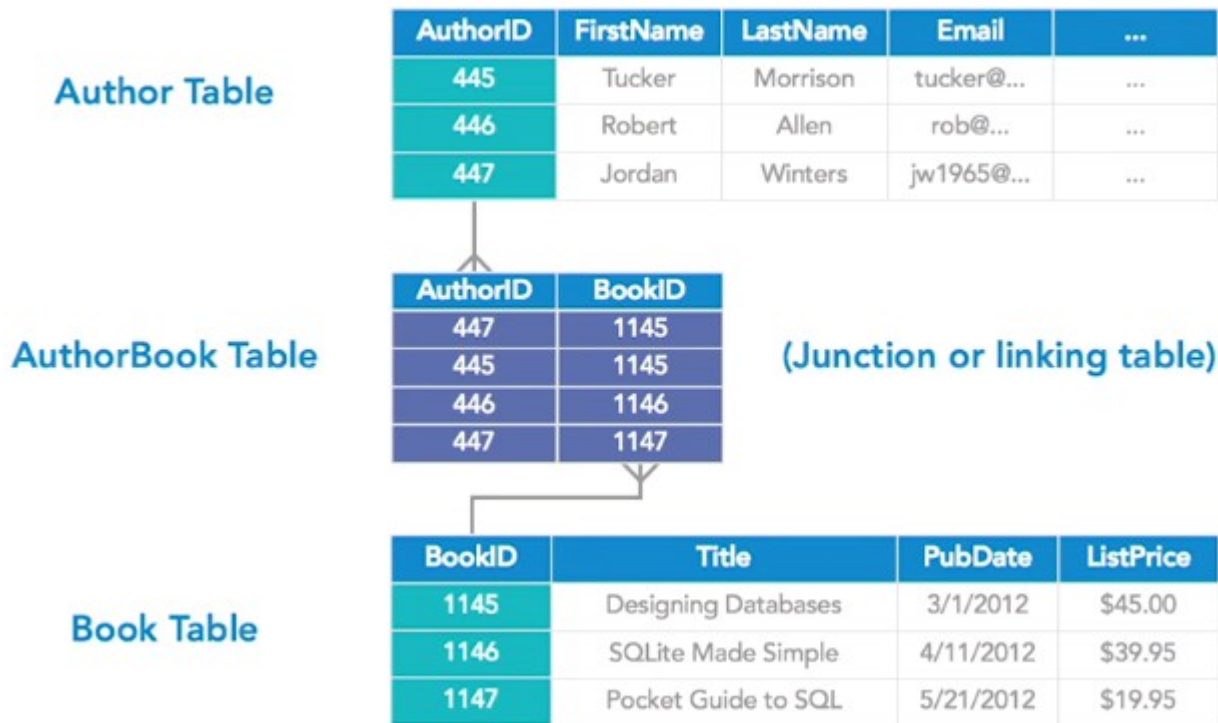

# One to Many Relationship

- One customer can have multiple orders.

# Many to Many Relationship

- ❑ Multiple authors can publish multiple books.

# One to One Relationship

Employee Table

EmployeeID	FirstName	LastName
27	Susan	Brandt
28	Jeremy	Buck
29	Elizabeth	Miller

Contact Info Table

EmployeeID	Email	Address
27	sbrandt@...	127 Main St.
28	jbuck@...	221 State St.
29	emiller@...	340 Adams Ave.

# Transactions and the ACID Test

# Banking Transaction

Account	AccountType	Balance
A2354542	Savings	\$6000

Account	AccountType	Balance
C9876567	Checking	\$12

Transaction

- \$2000

+ \$2000

# ACID Test

- A transaction should be:
  - **A**tomic
  - **C**onsistent
  - **I**solated
  - **D**urable
- This can be guaranteed by the DBMS after we provide the definition of the transaction.

# Introduction to SQL

- ❑ SQL stands for Structured Query Language.
  - SQL
  - Microsoft SQL Server
  - MySQL
  - PostgreSQL
  - SQLite
  - T-SQL
  - PL-SQL
  - etc

# Introduction to SQL

- ❑ SQL is a declarative query language, not a procedural, imperative language.
- ❑ SQL is small and focused.
- ❑ Example:
  - If we have a bookstore database
  - “I want all books with list price more than \$40”
  - SQL: `SELECT * FROM Books WHERE ListPrice > 40`

# Introduction to SQL

## □ SQL

- Create
- Read
- Update
- Delete

data from the database.

- An SQL can be used to create, not just your data, but to define the databases themselves.
